This standard may be applied to valves that do not meet the requirements of API 6A or API 6D at the user's discretion. This standard applies to valves with one or more closure members. This standard establishes acceptable levels for leakage through the test valve and external leakage after exposure to a fire for a 30-minute time period.

API 6F : RECOMMENDED PRACTICE FOR FIRE TEST FOR VALVES

Fire safe design is important for industrial valves in industries like oil and gas, chemical, and petrochemical. We often use API 6FA, and API 607 for fire testing. What are the differences between them? API 6FA is fire test for API 6A and API 6D valves, while API 6FD is for check valves. Regarding API 607, it is for quarter-turn valves and valves with soft seats.

Fire Safe Test API 6FA and API 607 - Dervos

API 6FA cover the requirements for testing and evaluating the performance of valves when exposed to fire. The burn period of 30 min. has been established on the basis that it represents the maximum time required to extinguish fire. The most important test conditions are: 1) The valve shall be filled with liquid and tested in the closed position.

API, 5/31/2019 API and NFPA Integration

API 6FA. API 6FA is currently in committee for its fourth edition. The third edition has been in place since 1999. As stated above, the standard was written to test API 6A and 6D valves. The test parameters are similar to API 607 for non-soft-seated valves, with the major difference in the operational test procedure after the cooldown period.

The Past, Present and Future of Fire Testing
