How Clouds Hold IT Together eBook by Marvin Waschke ...

The air can only hold a certain amount of water vapor, depending on the temperature and weight of the air - or atmospheric pressure - in a given area. The higher the temperature or atmospheric pressure, the more water vapor the air can hold. ... Clouds are made up of a bunch of cloud droplets bundled together with raindrops. Image credit ...

How Do Clouds Form? | NASA Climate Kids

When air rises in the atmosphere it gets cooler and is under less pressure. When air cools, it's not able to hold all of the water vapor it once was. Air also can't hold as much water when air pressure drops. The vapor becomes small water droplets or ice crystals and a cloud is formed. Water Vapor Condenses to Form a Cloud

Once these ingredients are in place, they follow this process to form a cloud: Step 1: Change Water Vapor into Liquid Water Although we can't see it, the first ingredient -- water -- is always... Step 2: Give Water Something to Sit on (Nuclei) In able for water droplets to form cloud droplets, they ...

Cloud Ingredients and Formation

Clouds are composed primarily of small water droplets and, if it's cold enough, ice crystals. The vast majority of clouds you see contain droplets and/or crystals that are too small to have any...

Why do clouds float when they have tons of water in them ...

This is also what holds the clouds up. In general, if a cloud is high up in the sky, the conditions just below it aren't right for the cloud to form. As the water droplets fall, they reach areas...

What holds clouds together? | Yahoo Answers

Clouds appear when there is too much water vapour for the air to hold. The water vapour (gas) then condenses to form tiny water droplets (liquid), and it is the water that makes the cloud visible. These droplets are so small that they stay suspended in the air.

What are clouds and how do they form? - Met Office

Most clouds form as warm air rises in the atmosphere and cools down. All air contains some water vapor and warm air can hold more water vapor than cold air. As warm air cools the water vapor turns into tiny droplets of water or ice. As more and more air cools down, more droplets form and they eventually become a cloud.

Why do clouds always appear to form in distinct clumps ...

Cool air can't hold as much water vapor as warm air, so some of the vapor condenses onto tiny pieces of dust that are floating in the air and forms a tiny droplet around each dust particle. When billions of these droplets come together they become a visible cloud. Why are clouds white? Since light travels as waves of different lengths, each ...
