Human Tooth Crown and Root Morphology

The anatomic crown of a tooth is the area covered in enamel above the cemento-enamel junction (CEJ) or "neck" of the tooth. Most of the crown is composed of dentin ("dentine" in British English) with the pulp chamber inside. The crown is within bone before eruption. After eruption, it is almost always visible. The anatomic root is found below the CEJ and is covered with cementum. As with the crown, dentin composes most of the root, which normally has pulp canals.

Human tooth - Wikipedia

This image of a human tooth cross section is a rendered view of a molar from our 3d teeth cross section model. It first requires decalcifying the central lower incisors sometimes the m1 molar or other tooth and then cutting cross sections of the root tips to a thinness measured in microns.

Cross Section Of A Tooth

A crown is a tooth-shaped cover positioned over a tooth that is
