All about Relational Database Models | Smartsheet

Relational Model (RM) represents the database as a collection of relations. A relation is nothing but a table of values. Every row in the table represents a collection of related data values. These rows in the table denote a real-world entity or relationship.

Relational Data Model in DBMS: Concepts, Constraints, Example

The relational data model provides conceptual tools to design the database schema of the relational database. The relational model describes the data, relationship between that data, data semantic and constraints on the data in the relational database. The relational model expresses the data and relationship among the data in the form of tables.

...

A relational database is a type of database that stores and provides access to data points that are related to one another. Relational databases are based on the relational model, an intuitive, straightforward way of representing data in tables. In a relational database, each row in the table is a record with a unique ID called the key. The columns of the table hold attributes of the data, and each record usually has a value for each attribute, making it easy to establish the relationships ...
