Master Thesis Reservoir Simulation Studies Of Formation

Reservoir simulation study the behaviour of fluid flow and provides numerical solutions to hydrodynamic problems of fluids in the petroleum reservoir-well systems with the help of a simulator. Reservoir simulation is used to predict the future performance of the reservoir so that intelligent decision can be made to optimize the economic recovery of hydrocarbons from the reservoir.

In this thesis, parameters that will influence shale gas production were classified into two categories: reservoir properties and hydraulic fracture properties. Published shale gas simulation studies were surveyed for determining the typical ranges of those properties. CMG-GEM was employed to finish the reservoir simulation work, and CMG-
