stress test (CST) • Biophysical profile (BPP) If you have a high-risk pregnancy, talk with your doctor or other medical professional about any prenatal tests you will be given.

Nonstress Tests and Stress Tests During Pregnancy

A nonstress test (NST) is a screening test used in pregnancy to assess fetal status by means of the fetal heart rate and its responsiveness. A cardiotocograph is used to monitor the fetal heart rate and presence or absence of uterine contractions. The test is typically termed "reactive" (also "reassuring") or "nonreactive" (also "nonreassuring").

Nonstress test - Wikipedia

The test is named "non-stress" because no stress is placed on the fetus during the test. How is an NST Performed? The test involves attaching one belt to the mother's abdomen to measure fetal heart rate and another belt to measure contractions. Movement, heart rate and "reactivity" of heart rate to movement are measured for 20-30 minutes. If the baby does not move, it does not necessarily indicate there is a problem; the baby could just be asleep.

Fetal Non-Stress Test (NST): American Pregnancy Association
