- An indwelling catheter for which continuing use is not medically justified is discontinued as soon as clinically warranted;
- Services are provided to restore or improve normal bladder function to the extent possible, after the removal of the catheter; and
- A resident, with or without a catheter, receives the appropriate care and services

CMS Manual System

Use a midline catheter or peripherally inserted central catheter (PICC), instead of a short peripheral catheter, when the duration of IV therapy will likely exceed six days. Category II; Evaluate the catheter insertion site daily by palpation through the dressing to discern tenderness and by inspection if a transparent dressing is in use.

Recommendations | BSI | Guidelines Library | Infection ...

A PICC (peripherally inserted central catheter) is a type of catheter, normally inserted in the upper arm. A PICC line is a safe, stable way to deliver intra-venous (IV) medications. It can stay in the body for weeks or months, alleviating the need to subject your veins to the numerous needle sticks necessary if the PICC was not there.
