In estimation theory, the extended Kalman filter (EKF) is the nonlinear version of the Kalman filter which linearizes about an estimate of the current mean and covariance. In the case of well defined transition models, the EKF has been considered the de facto standard in the theory of nonlinear state estimation, navigation systems and GPS.

Extended Kalman filter spectrophotometry (EKF) is a filtering algorithm for nonlinear systems [ 29, 30 ], so it is proposed to iteratively detect nickel concentration. The detection range was found to be 0.5–5 mg/L for copper, 0.3–3 mg/L for cobalt and 0.6–6 mg/L for nickel.

Description. The Extended Kalman Filter block estimates the states of a discrete-time nonlinear system using the first-order discrete-time extended Kalman filter algorithm.. Consider a plant with states  $x$ , input  $u$ , output  $y$ , process noise  $w$ , and measurement noise  $v$ . Assume that you can represent the plant as a nonlinear system.

An Extended Kalman Filter (EKF) is proposed for inductor current estimation and output voltage filtering. With this approach, the

9.2: EKF for parameter estimation Here, we show how to use EKF for parameter estimation. As always, we proceed by deriving the six essential steps of sequential inference. EKF step 1a: Parameter estimate time update. The parameter prediction step is approximated as  $\hat{\theta}^-_k = E[\theta_{k-1} + r_{k-1} | D_{k-1}] = \hat{\theta}^+_{k-1}$ .
